

Performance Tops

Is water, debris and snow blowing out bulbs?

Curved performance tops have been designed for the more harsh airfield environments. The result is a tighter seal that nearly eliminates the penetration of water and debris. The curved performance top also improves the sign's already excellent aerodynamics, further combating jet blast & reducing structural stress. Curved tops create a stronger, stiffer sign frame & provide increased support for the face panels.

Modifying made easy

- Bolts into existing sign frame
- Simple upgrade from flat top design

Tighter seal

- Reduces water/moisture penetration
(Potential cause of premature lamp failure)
- Keeps contaminants and dirt out

Curved design

- Adds structural strength
- Improved aerodynamics sheds jet blast
